Assignment 1

Introduction to Bayesian Data Analysis 2025

Ana Sofia Acevedo (#StudentID)

Preamble

- **Points**: Assignment 1 comprises of 6 tasks, 2 points each (12 in total). 2 points are obtained for complete and correct answers. 1 point is obtained for a proper approach or if only part of the task is solved.
- Submission: Hand in the assignment as a PDF Markdown report. The report should show the results, the code that produced the results, and additional text or comment. The report should appear clean and be uploaded on Moodle until Wednesday, June 04, 9:45 am.
- Collaboration: Reports can be handed in as team work (max. 2 people). When working in teams, declare this on page 2. However, each collaborator needs to hand in a report via Moodle, stating their name, student number (p. 1), and their machine specification (p. 2).
- Permitted and Prohibited: You may use materials from this class (e.g., slides, code on GitHub) as well as online forums such as Stack Overflow to write your code. However, you are not allowed to post questions from the assignment online or prompt them (including paraphrases) to LLMs/chatbots. All use of LLMs/chatbots is generally not allowed. Solutions may not be shared with other students from the class (except 1 potential collaborator).

Authorship Information

1.	Declaration of Collaboration
	□ Yes (Collaborator name)⋈ No
2.	Declaration of Authorship
	☐ I certify that this assignment represents my own work. I have not used any unauthorized or unacknowledged aids as stated in the preamble, including free or commercial systems or services offered on the internet or text generating systems embedded into software. I did not copy code from someone else nor did I share my code with someone else.
3.	System Information
	\Box I confirm that I generated the submitted PDF report myself using R version 4.5.0 (2025-04-11 ucrt) and Quarto/RMarkdown.

Task Set 1

For tasks 1.1-1.3, assume you throw 3 dice—normal dice with 6 sides each ;-)

Task 1.1

Create a data frame with all possible combinations (outcomes) that can result from throwing all three dice. Each row should represent one possible outcome. Print the first/last 10 rows and the total number of possible outcomes to the output.

```
library(gtools)
perm <- as.data.frame(permutations(6,3, repeats.allowed = TRUE))
print(head(perm, 10))</pre>
```

```

209 6 5 5
210 6 5 6
211 6 6 1
212 6 6 2
213 6 6 3
```

```
214 6 6 4
215 6 6 5
216 6 6 6
```

```
print(nrow(perm))
```

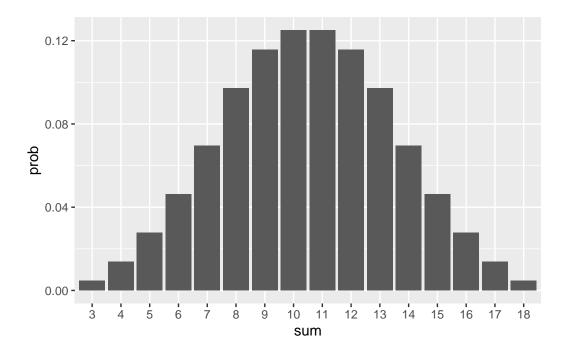

[1] 216

Task 1.2

Create a data frame showing all possible sums that can result from throwing the three dice (e.g., if all three dice show a 1, the sum is 3) along with their probabilities. Print the data frame to the output and visualize the distribution in a plot.

```
library(ggplot2)
data <- as.data.frame(table(rowSums(perm)))
colnames(data) <- c("sum", "prob")
data$prob <- data$prob/sum(data$prob)
print(data)</pre>
```

```
sum
             prob
1
     3 0.00462963
2
     4 0.01388889
3
     5 0.02777778
4
     6 0.04629630
    7 0.06944444
    8 0.09722222

    10 0.12500000
    11 0.12500000
10 12 0.11574074
11 13 0.09722222
12 14 0.06944444
13 15 0.04629630
14 16 0.02777778
15 17 0.01388889
16 18 0.00462963
ggplot(data, aes(x=sum, y=prob)) +
  geom_bar(stat = "identity")
```

Task 1.3

Which of the following events is more likely?

- \boxtimes A. The sum is \geq 12, given that at least one of the dice shows a 4.
- \square B. The sum is ≤ 10 , given that at least one of the dice shows a 5.

```
perm$total <- rowSums(perm)
num_1 <- nrow(perm[(perm$total>=12) & (perm$V1==4 | perm$V2==4 | perm$V3==4),])/nrow(perm)
den_1 <- nrow(perm[(perm$V1==4 | perm$V2==4 | perm$V3==4),])/nrow(perm)
num_1/den_1</pre>
```

[1] 0.4065934

```
num_2 <- nrow(perm[(perm$total<=10) & (perm$V1==5 | perm$V2==5 | perm$V3==5),])/nrow(perm)
den_2 <- nrow(perm[(perm$V1==5 | perm$V2==5 | perm$V3==5),])/nrow(perm)
num_2/den_2</pre>
```

[1] 0.3296703

Task Set 2

For Task 2.1-2.3, assume you toss a globe 10 times, leading to either land or water.

Task 2.1

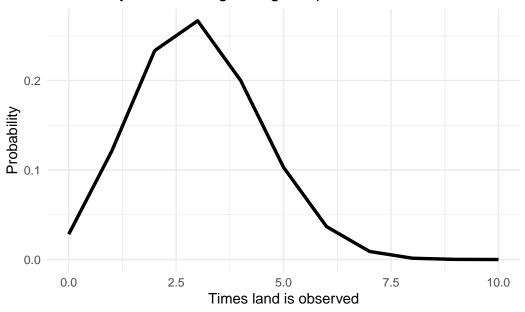

Compute the probability of all possible numbers of occurrence of land, given the candidate proportion of .3. Report the results in a summary table and a plot and indicate whether the plot shows a probability distribution or a likelihood function.

```
# i is the number of times that land is observed, so 10-i is the number of times water is ob
df <- data.frame(land = 0:10, probs = rep(0,11))
for (i in 0:10){
   df[i+1, 2] <- dbinom(i, size = 10, prob = 0.3)
}
df</pre>
```

```
probs
  land
1
      0 0.0282475249
      1 0.1210608210
      2 0.2334744405
      3 0.2668279320
5
     4 0.2001209490
6
     5 0.1029193452
      6 0.0367569090
     7 0.0090016920
     8 0.0014467005
10
      9 0.0001377810
11
    10 0.0000059049
```

Warning: Using `size` aesthetic for lines was deprecated in ggplot2 3.4.0. i Please use `linewidth` instead.

Task 2.2

Assume you observe 8 water. Take the candidate proportions of land $\mathtt{cp} = 0, 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1$. For each of these candidates, compute the probability of this observation. Report the results in a summary table and a plot and indicate whether the plot shows a probability distribution or a likelihood function.

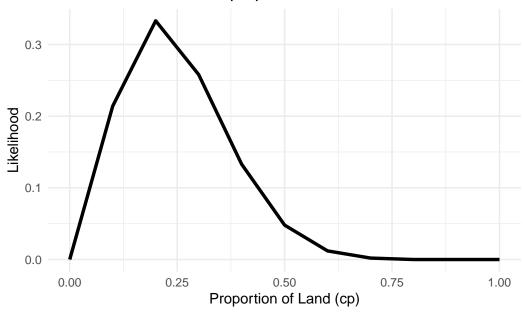

```
# Es como la que esta en session_05 compute_post, da exactamente igual
counter_prob_1 <- function(data, cp){
    L <- sum(data == "L")
    W <- sum(data == "W")
    probs <- (cp)^L * ((1 - cp))^W
    probs <- probs/sum(probs)
    data.frame(cp, probs)
}

data <- c(rep("W", 8), "L","L")
cp_seq <- seq(0, 1, 0.1)
results <- counter_prob_1(data, cp = cp_seq)
results$probs <- round(results$probs, 3)</pre>

df_1 <- data.frame(cp = seq(0, 1, 0.1), probs = rep(0,11))
```

```
count <- 1
for (i in seq(0, 1, 0.1)){
  df_1[count, 2] \leftarrow dbinom(2, size = 10, prob = i)
  count <- count+1</pre>
}
df_1$probs <- df_1$probs / sum(df_1$probs)</pre>
df_1$probs <- round(df_1$probs, 3)</pre>
df_1
    cp probs
1 0.0 0.000
2 0.1 0.214
3 0.2 0.333
4 0.3 0.258
5 0.4 0.133
6 0.5 0.048
7 0.6 0.012
8 0.7 0.002
9 0.8 0.000
10 0.9 0.000
11 1.0 0.000
library(ggplot2)
library(tidyr)
ggplot(results, aes(x = cp, y = probs)) +
  geom_line(size = 1.2) +
  labs(title = "Likelihood of candidate proportions of Land",
       x = "Proportion of Land (cp)",
       y = "Likelihood") +
  theme_minimal()
```

Likelihood of candidate proportions of Land

Task 2.3

For each candidate proportion of land, compute the probability of all possible number of occurrences of land. Report the results in a summary table, showing the probability distributions as columns and the likelihood functions as rows.

```
cp_seq <- seq(0, 1, 0.1)
land <- c(0:10)
df_2 <- data.frame(matrix(0, nrow=length(land), ncol=length(cp_seq)+1))
colnames(df_2) <- c("land", as.character(cp_seq))
df_2$land <- land

for (i in land){
   for (j in cp_seq){
      df_2[i+1,as.character(j)] <- dbinom(i, size = 10, prob = j)
   }
}</pre>
```
